**Job title >** Postdoc position in quantitative live-cell imaging

**Job description >**

Understanding the molecular mechanisms that drive life (and those that lead to death) requires structural characterization of the protein machinery sustaining the biology of the cell. Structural biology methods have been largely centred in in vitro approaches, which provides high-resolution measurements but limited physiological relevance. In our lab, we have recently developed a new live-cell structural biology method based on cell engineering and quantitative live-cell imaging. Our approach, capable of measuring the separation between fluorophores with up to 2 nm precision, allows us to investigate chemical structures in vivo. Thus, we can use light microscopy to reconstruct the architecture of molecular assemblies directly in living cells (Picco et al, 2017, Cell). With this and other complementary tools, we are now poised to solve long-standing questions in cell biology that were not accessible by other techniques. We would like to incorporate a researcher that follows up this line of research to investigate mechanisms of cell growth. The successful candidate will complement our research activity with his/her expertise in the fields of optical physics, quantitative live-cell imaging and/or image analysis.

**Project and Institution that finance the contract**

The position is funded with a 3-year grant of the Spanish Government (Agencia Estatal de Investigación). The successful candidate will join the group of Oriol Gallego at the department of Experimental and Health Sciences (DCEXS) of the Pompeu Fabra University (UPF). The candidate will be part of an emerging research lab devoted to study supra-molecular machineries that control cell growth. The candidate will continue the development of new intracellular nanotools that enhance the resolute power of live-cell imaging, aiming at pushing light microscopy in the research field of Structural Biology. Starting date end2019/beginning-2020.

The department of Experimental and Health Sciences of the Pompeu Fabra University ([www.upf.edu/web/biomed](http://www.upf.edu/web/biomed)) is located at the PRBB (Barcelona, Spain). PRBB, one of the strongest scientific campus in south Europe, is equipped with state-of-the-art research facilities in a unique scientific environment. The research excellence of our center has been recognized with a Maria de Maeztu award.

AEI-PGC2018-095745-B-I00 (FEDER/UE)

**Information on the minimum requirements**

- Highly motivated, enthusiastic and creative researcher.
- PhD in Cell biology, Optical physics, Computer Science, Engineering or equivalent with experience in quantitative fluorescence microscopy.

Universitat  
Pompeu Fabra  
Barcelona

Departament  
de Ciències Experimentals  
i de la Salut

FONDO EUROPEO DE  
DESARROLLO REGIONAL  
*Una manera de hacer Europa*  
FONDO SOCIAL EUROPEO  
*El FSE invierte en tu futuro*

- Advanced coding skills with Matlab, R and/or Python for image analysis required - Experience in localization microscopy, particle tracking and molecular counting from intensity ratiometric comparison are a plus.
- Excellent written and oral communication skills in English.

### Benefits of the opening

We offer a 2.5-years contract with 24k gross salary, with possibility to increase according to the candidate's expertise. Starting on January 2020 and with possibility of extension.

Location: The laboratory is located in the Barcelona Biomedical Research Park which, with a privileged location on the shoreline of the Mediterranean sea, constitutes one of the most exciting interdisciplinary research centers in Southern Europe with more than 1000 scientists in the building alone.

### Information on the application process

To apply, send your CV, a letter of interest and a minimum of 2 letter of reference to Dr Oriol Gallego (<mailto:oriol.gallego@upf.edu>) before end of July 2019.

**Deadline to submit applications 09/08/2019**

**Contact** PhD Oriol Gallego
