**Job title. Research position in quantitative live-cell imaging of exocytosis**

### **Job description**

Understanding the molecular mechanisms that drive life (and those that lead to death) requires structural characterization of the protein machinery sustaining the biology of the cell. Structural biology methods have been largely centered in in vitro approaches, which provides high-resolution measurements but limited physiological relevance. In our lab, we have recently developed a new live-cell structural biology method based on cell engineering and quantitative live-cell imaging. Our approach, capable of measuring the separation between fluorophores with up to 2 nm precision, allows us to investigate chemical structures in vivo. Thus, we can use light microscopy to reconstruct the architecture of molecular assemblies directly in living cells (Picco et al, 2017, Cell). With this and other complementary tools, we are now poised to solve long-standing questions in cell biology that were not accessible by other techniques. We would like to incorporate a researcher that follows up this line of research to investigate mechanisms of cell growth. The successful candidate will complement our research activity with his/her expertise in the fields cell biology, quantitative live-cell imaging and/or image analysis.

### **Project and Institution that finance the contract**

The position is funded with a 3-year grant of the Spanish Government (AEI-PGC2018-095745-B-I00 (FEDER/UE), Agencia Estatal de Investigación). The successful candidate will join the group of Oriol Gallego at the department of Experimental and Health Sciences (DCEXS) of the Pompeu Fabra University (UPF). The candidate will be part of an emerging research lab devoted to study supra-molecular machineries that control cell growth. The candidate will continue the development of new intracellular nanotools that enhance the resolute power of live-cell imaging, aiming at pushing light microscopy in the research field of Structural Biology and he/she will develop an automated approach for particle tracking to quantify vesicle dynamics.

The department of Experimental and Health Sciences of the Pompeu Fabra University ([www.upf.edu/web/biomed](http://www.upf.edu/web/biomed)) is located at the PRBB (Barcelona, Spain). PRBB, one of the strongest scientific campus in south Europe, is equipped with state-of-the-art research facilities in a unique scientific environment. The research excellence of our center has been recognized with a Maria de Maeztu award.

### **Information on the minimum requirements**

- BS in Biology, Biochemistry or similar
- Highly motivated, enthusiastic and creative researcher.
- Previous experience in the analysis of quantitative fluorescence microscopy and Membrane biology.

### **Benefits of the opening**

We offer a 1.5-months contract with 1.370,85€/month gross salary. Starting on September 2020 and with possibility of extension.

Location: The laboratory is located in the Barcelona Biomedical Research Park which, with a privileged location on the shoreline of the Mediterranean sea, constitutes one of the most exciting
