

Advanced Techniques in Macroeconomics III

2022-2023 Academic Year

Master of Research in Economics, Finance and Management

1. Description of the subject

- Advanced Techniques in Macroeconomics II
- Total credits: 3 ECTS Workload: 75 hours
- Term: 1st
- Type of subject: Optative
- Department of Economics and Business
- Teaching team: Barbara Rossi (TA assistant: TBA)

- **Please note: some of the information in this syllabus and its activities depend on the evolution of the COVID-19 pandemic.**

2. Teaching guide

• Introduction

This course examines the models and econometric techniques used to study time series data with a special emphasis to applications in macroeconomics.

The course has three specific objectives. The first is to equip students who anticipate using time series data in their Ph.D. research with the tools they need for state-of-the-art empirical research. The second objective is to lay out the econometric theory of time series analysis, with an emphasis on recent developments. The third objective is to analyze selected recent works in theoretical macroeconomic modeling with an emphasis on their empirical implications and analysis. The course is built so that for each topic the econometric tool is presented first, followed by the relevant empirical applications.

This course (*Advanced techniques in Macroeconomics I*) plus the *Topics in Macroeconomics I* course are, together, the same course I taught in the past at UPF; by taking both, a student would take the *Advanced Time Series* class I offered in the past. The difference between the *Topics* class and the *Advanced Techniques* class that I am teaching this term is that the *Topics* class is *more applied*, with an emphasis of some recent developments in VARs and Local Projections, while the *Advanced Techniques* class is a class covering several *fundamental tools* in time series analysis that anyone working with time series data should be familiar with. I would recommend any student interested in working with time series data in his/her PhD to take both classes.

Pre-requisites: The course builds and extends “Advanced Econometric Methods I, II and III”, which are therefore pre-requisites. Alternatively, students should obtain the Professor’s special permission to take the course.

The course meets regularly on **Tuesdays and Thursdays, 8:30-10:30 am, in room TBA**. Attendance to class is mandatory. A few classes may need to be re-scheduled, the changes will be announced in class. When needed, some lectures will be rescheduled **on a day/time TBA**.

My email is: barbara.rossi@upf.edu and my office is Jaume I (building 20), n. 207. My office hours will be on Monday morning, from **10:30 to 11:30**. The TA for the class is Jiaming Huang and the TA’s email is: jiaming.huang@upf.edu. **TA sessions are scheduled on TBA in room TBA.**

The course grade is based 40% on midterm, 50% on final and 10% on problem sets and presentations.

General references:

Hamilton, J., 1994. *Time series econometrics*. Princeton: Princeton University Press.

Kilian and Lutkepohl, 2018. *Structural VAR Analysis*, Cambridge

Hayashi, F., 2000. *Econometrics*. Princeton: Princeton University Press.

Canova, F., 2007. *Methods for applied macroeconomic research*. Princeton: Princeton University Press.

Important: this syllabus is preliminary and the contents of the course may change during the semester; in particular, some of the discussion papers might be updated later on –please come to classes to keep up with the contents! Also, it is very comprehensive, not all papers/topics may be discussed in class.

Also important: the department offers an Econometrics Seminar as well as the Barcelona GSE Time Series Summer Forum, both of which are open to students, and complement the course with frontier research on the topics. Attendance is strongly recommended. These activities are really part of the course and will help you integrate with the research done in the time-series / applied macro literature! And they will be fun!

Short presentations by students:

One of the objectives of the class is to teach students to critically read and understand papers, both theoretical and applied. We will devote some time each week to your reading and presentation of papers related to the course. On Tuesdays, all students should come with 5 slides prepared on a paper I will select, and be prepared to discuss the following 5 points (one per slide):

1. Background: what did the previous related literature do?
2. What is the main contribution of this paper and why does it advance the literature in 1?
- 3-4. Main results, findings (both theoretical and empirical) – include intuition
5. Your thoughts: criticisms, improvements, open questions, etc.

One student will be randomly picked for presentation. Be prepared to answer questions.
