**GDPR:** General Data Protection Regulation.

Regulation (EU) 2016/679 on the protection of natural persons with regard to the processing of their personal data

**Personal data:** Any information related to an identified or identifiable individual (the *data subject*)

- Personal data is pervasive in social media
- We will use Twitter as an example
- All Social Media platforms share similar situations

# What's in a Tweet?

GDPR stipulates that any processing of personal data shall be grounded in one of 6 possible legal bases.

In the vast majority of cases the legal basis for processing personal data in a research project is data subjects' consent

So, what can we do to conduct research with personal data extracted from social media networks?

- 1) If possible, seek users' consent to process their data
- 2) If not possible, anonymise the data prior to their storage and processing

**Anonymisation:** application of a process to personal data so the link to the data subject is permanently removed

GDPR is not applicable to anonymised data

- The rest of this presentation is about techniques to anonymise data collected from social media

# Coping with dates and numbers

|   |  |
|---|--|
| Anonymization by aggregation                  | <i>Use statistical values (mode, median, standard deviation..) instead of keeping individual figures.</i>                      |
| Adding white noise (random number)            | <i>Add <math>X, X \sim U(-a, a)</math> to each individual figure, so statistical properties of the sample will not change.</i> |
| Use of hash algorithms                        | <i>Hash algorithms are susceptible to brute force attacks.<br/>'Salted' hash minimizes the issue.</i>                          |
| Remove a random number of samples             | <i>If there is certainty that an element is in the sample, it is easier to find.</i>   |
| Use data in ranges                            | <i>E.g., if you have to process account creation date, use ["&lt; one year old", "between 1 and 5", "more than 5 y.o."]</i>    |
| <b>Always perform a reidentification test</b> | <i>Best results if reidentification test is conducted by a colleague</i>   |

## To sum up:

- If you make use of personal data extracted from social media for your research:
  1. Seek users' consent, if possible
  2. Anonymise the data by adapting the ideas expressed in this presentation to your research and
    - Do not store interim personal data
      - Anonymisation shall be conducted 'on the fly'
      - If you need to recreate the dataset, re-run the process
  3. Always seek certification by a research ethics committee
    - Research with social media data is an evolving topic
    - Ideas expressed in this presentation may change in the future

Universitat  
Pompeu Fabra  
*Barcelona*

GDPR stipulates that any processing of personal data shall be grounded in one of 6 possible legal bases.

In the vast majority of cases the legal basis for processing personal data in a research project is data subjects' consent. But GDPR provides extra room for the so called 'further processing': when personal data is used for a processing different than the one for which data was collected

Considerations when further processing of personal data (GDPR's art. 6.4)

*Social Media users posted their personal data for a purpose, researchers 'further process' that data for a different purpose (research)*

- 1) Linking between initial purpose and intended further processing
- 2) Context in which the personal data was collected
- 3) Nature of personal data (special categories of PD, profiling data...)
- 4) Possible consequences of the further processing
- 5) Existence of appropriate safeguards
