#### State of the art

- Group of platform workers studied: mostly taxi drivers and delivery workers. Lack of studies of online
  workers or other types of onsite platform workers (e.g. cleaners, plumbers, etc.)
- Outcomes studied:
  - Mental health (fatigue, stress, sleep deprivation) → This is the most common outcome studied
  - · Subjective well-being (general health)
  - Musculoskeletal pain
  - · Safety concerns (self-protection, harrassment)
  - · Injuries/accidents
  - COVID-related consequences
- · Quality of the studies:
  - · Definition of digital platform work (mixed study populations, mixed types of platform work)
  - Measurements of the outcomes: lack of use of validated instruments
  - Quantitative studies (all cross-sectional): the majority do not include a control group (non-exposed group)

#### Focus of the project

#### **Project overview**

Aim 1: Investigate the OSH risks and regulations of platform work.

Aim 2: Provide recommendations to foster a safe and healthy occupational environment for platform workers in Europe.

WP1: A cross-national survey among platform workers with 6-months follow-up.

WP2: Qualitative interviews about the subjective experience among platform workers

WP3: Desk research on policy + interviews with platform managers, labour inspectors, labour union representatives

#### **Research partners**

| Well informed                              | 45,9% | 46,6% | 7 |
| Not very well informed                     | 24,6% | 17,9% | V |
| Not at all informed                        | 15,6% | 12,8% | 1 |

### First results

While digital labour platforms initially tended to exploit the regulatory grey zones across European labour markets to abrogate and circumvent the traditional employer responsibility of employee protection, they are increasingly utilising the national platforms for social dialogue to develop unilateral, bipartite and in some instances tripartite health and safety initiatives to protect platform workers. This shift from being what can be characterised as rule-preventers towards being rule-makers appear largely driven by the pressures from the broader institutional setting, where the national context appears pivotal for the health and safety solutions. To push forward new regulation, digital platforms and social partners particularly, such as trade unions and employers' organisations, have utilised their institutional power resource, but often in different combinations with their available associational, coalitional, ideational and structural power resources. Their combinations of power resources appear not only closely tied to the national context, but also seem to influence their regulatory approach - statutory law, collective bargaining, unilateral initiatives, or case law rulings - as well as their role as rule-makers, rule takers or rule preventers when addressing the regulatory health and safety loopholes within the platform economy. However, as a consequence of these combinations, platform workers are now less protected in some countries and subsectors than others.
