

Leonardo Grilli, PhD, is Full Professor of Statistics at the University of Florence and Director of the Master program in Statistics, actuarial and financial sciences. He is a member of the board of the Doctoral Program in Development Economics and Local Systems at the University of Florence. His teaching activity focuses on introductory statistics and statistical modelling, including generalized linear models and multilevel models. His research mainly concerns random effects models for multilevel analysis, with methodological advances about the specification and estimation of models in complex frameworks such as duration data, multivariate qualitative responses, informative sampling designs, and sample selection bias. He also gave contributions regarding causal inference in the potential outcomes framework, IRT models, latent growth curve models, mixture models, and quantile regression. The methodological work is driven by applications on real data in different fields mainly in the social sciences, but also in demography and medicine.

Carla Rampichini, PhD, is Full Professor of Statistics at the University of Florence. She is a member of the board of the Doctoral Program in Development Economics and Local Systems at the University of Florence. Her teaching activity focuses on introductory statistics, multivariate analysis and statistical modelling, including generalized linear models and multilevel models. Her research interests relate to random effects models for multilevel analysis, program evaluation, and causal inference. Her methodological work is joined with applications on real data, often concerning the effectiveness of universities. She is member of the Royal Statistical Society and of the Italian Statistical Society. She is co-editor of *Statistical Methods and Applications* and she has served as referee for many national and international journals.
