

# **MULTILEVEL 1 (Practical multilevel modelling)**

Leonardo Grilli & Carla Rampichini

Dipartimento di Statistica, Informatica, Applicazioni “G. Parenti”

Università di Firenze

## **Course description**

The course introduces the concepts of multilevel analysis, whose main aim is to model the relationships between and within groups. Typical situations include individuals clustered into families, schools, firms, geographical areas. The course focuses on the two-level linear model as a template to illustrate issues of specification, estimation and inference. The main ideas are illustrated through case studies. A typical field of application is education, where students are clustered into schools: the first case study aims at assessing the role of student and school factors on student achievement. Another relevant field of application of multilevel models is the analysis of cross-country data such as the European Social Survey: the second case study concerns political trust in Europe, considering individual and country-specific characteristics. The case studies are worked out with Stata 15. Moreover, each lesson includes guided exercises using Stata. Special attention is devoted to critical and controversial issues, such as group-mean centering of the covariates, sample size requirements, choosing between fixed and random effects, and using sampling weights.

## **Software**

Stata 15

## **Prerequisites**

Basic knowledge of statistical inference and linear regression. Knowledge of Stata is helpful but not necessary (files with commands are always provided).

## Schedule

### July 01 2019

Time	Topic
9:00 -11:00	Basics of multilevel analysis: theory
11:00-11:20	Break
11:20-13:00	Basics of multilevel analysis: case study 1

### July 02 2019

Time	Topic
9:00 -11:00	Model specification, estimation and inference: theory
11:00-11:20	Break
11:20-13:00	Model specification, estimation and inference: case study 2

### July 03 2019

Time	Topic
9:00 -11:00	Fixed and random effects, complex structures, weighting
11:00-11:20	Break
11:20-13:00	Review and further examples

## Pictures

## Short bio

Leonardo Grilli, PhD, is Full Professor of Statistics at the University of Florence and Director of the Master program in Statistics, actuarial and financial sciences. He is a member of the board of the Doctoral Program in Development Economics and Local Systems at the University of Florence. His teaching activity focuses on introductory statistics and statistical modelling, including generalized linear models and multilevel models. His research mainly concerns random effects models for multilevel analysis, with methodological advances about the specification and estimation of models in complex frameworks such as duration data, multivariate qualitative responses, informative sampling designs, and sample selection bias. He also gave contributions regarding causal inference in the potential outcomes framework, IRT models, latent growth curve models, mixture models, and quantile regression. The methodological work is driven by applications on real data in different fields mainly in the social sciences, but also in demography and medicine.

Carla Rampichini, PhD, is Full Professor of Statistics at the University of Florence. She is a member of the board of the Doctoral Program in Development Economics and Local Systems at the University of Florence. Her teaching activity focuses on introductory statistics, multivariate analysis and statistical modelling, including generalized linear models and multilevel models. Her research interests relate to random effects models for multilevel analysis, program evaluation, and causal inference. Her methodological work is joined with applications on real data, often concerning the effectiveness of universities. She is member of the Royal Statistical Society and of the Italian Statistical Society. She is co-editor of *Statistical Methods and Applications* and she has served as referee for many national and international journals.
